Full-Process Management of Hazardous Chemical Substances in Products

Product Development

In compliance with the and the

referencing the *Principles of Green Chemistry*, the Company integrates environmental and health impact assessments throughout the entire lifecycle during the feasibility analysis and product design phases. The requirements for hazardous substance management are implemented within product design specifcations and subsequent verifcation processes to minimize hazardous substances at the source.

Material Procurement

A comprehensive identifcation and supe r ision process has been established. Verifed qualifed suppliers are required to submit full material composition declarations and test ce r ifcates for materials through the Green Products (GP) module of the GSCM system. Specialists are responsible for reviewing these submissions to ensure compliant material infow.

Replacement of Hazardous Substances

Luxshare Precision has established the long-term plan to phase out all chemicals of concern. The Company closely monitors dynamic changes in domestic and international laws, regulations, and customer standards, systematically reviewing and optimizing all aspects of restricted substance management. We have formulated and are actively advancing a series of hazardous substance phase-out initiatives, focusing on the development and implementation of safer alternative materials and production processes to minimize the use of hazardous substances in our products.

Schedule and Implementation Progress of Hazardous Substance Phase-out and Replacement Plans

Scheduled Phase-out / Replacement Year	Substance (Substance Group)	Afected Materials/ Products	Progress/Status

[23] Immediate phase-out implementation across all new products

Case Lanto Kunshan Conducted Hazardous Substance Phase-out for Eco-Friendly Cable Product Advancement

Lanto Kunshan actively responds to the hazardous substance phase-out plan by conducting a comprehensive screening of hazardous substances in new product materials and initiating the selection process for alternative material solutions for homogeneous materials containing PFAS. Following rigorous technical comparison and feasibility analysis, we have selected PFAS-free materials that meet the requirements for replacement and have completed the comprehensive implementation of these materials.

Case Luxshare Xuancheng Advanced the Upgrade of Cleaning Agents, Achieving a Signifcant Reduction in VOCs Emissions

Luxshare Xuancheng responded to the Company's ongoing plan to phase out VOCs by upgrading cleaning agents for environmental compliance. The original general solvent-based cleaning agents were replaced with semi-aqueous cleaning agents, resulting in an 86% reduction in VOCs content within the solvents. This process replacement not only furher solidifes environmental compliance and risk management but also signifcantly reduces VOCs emissions at the source of the production process.

Hazardous Substance Management Requirements of the Supply Chain

As a critical link connecting suppliers and customers, we recognize that conveying clear raw material requirements to suppliers is a vital prerequisite for delivering high-quality green products. To ensure the environmental compliance of procurement materials, we integrate green product requirements throughout the entire supplier management process. By applying the GSCM system's GP module for full-chain digital management, we standardize supplier behavior with high standards consistent with Luxshare Precision's own management practices. This initiative drives suppliers to enhance their management of hazardous substances and reduce supply chain risk.

Hazardous Substances Management Requirements of the Supply Chain

Entr	Require raw material suppliers to sign the to ensure that raw materials, components, packaging materials, semi-fnished products and fnished products supplied to Luxshare Precision meet the management requirements of the
	Timely communicate with and require suppliers to complete self-inspection, feedback and confrm compliance within the prescribed time limit after the is updated. Moreover, suppliers are required to proactively repor any changes related to raw material properies and other relevant aspects. Where applicable, they should also provide relevant information and samples as required, implement supply changes only after approval is obtained
	Conduct regular audits related to the control of hazardous substances, check the product ingredient list and third-pary hazardous substance testing repor, and send it to the Company's internal laborator for hazardous substance testing to prevent the non-environmentally friendly materials and products from fowing into the Company's product chain
	Actively carr out the replacement or reduction of hazardous chemical substances, and phase out hazardous chemical substances or replace them with safer chemical substances as soon as practicable
